A fixed delay period exist between the rising edge of EXPOSURE1 and the rising edge of the video valid period (LVAL).</li> <li>• The exposure time is equal to the period between the rising edges of the EXPOSURE1 (EXSYNC) pulses.</li> <li>• The exposure time is variable and controlled by the external trigger period.</li> <li>• Note, in this DCF the PRIN signal is connected on EXPOSURE 2 of the Matrox Genesis and is always active.</li> </ul> 

# Application Note:

## Interfacing non-standard cameras to Matrox Genesis

DALSA CT-C5-4096A

April 23, 1998

### Camera Interface Details (continued)

**Maximum line rate** : the maximum occurrence of the external trigger. It is important that the period of the external trigger signal is longer than the video valid output delay + the video valid output time, therefore:

$$\text{Maximum Trigger Frequency} = \frac{1}{\text{EXPOSURE1 period}}$$

$$\text{Video Valid} = 1024 \times \frac{1}{512} = 68\text{ms}$$

$$\text{Delay} = 4\text{ms} + 11\text{mclk} + 400\text{ns} = 4\text{ms} + 0.73\text{ms} + 0.26\text{ms} + 400\text{ns} = 5.39\text{ms}$$

**Minimum exposure time** : for proper operation of Genesis hardware, exposure signal must remain inactive for a minimum of 8 clock periods before being asserted. Therefore:

$$\text{Minimum Exposure Time} = \text{EXPOSURE 1 min. low time}$$

$$= 8 \text{ clock periods} \times \frac{1}{15\text{MHz}} = 5.3\text{ns}$$

**Smallest exposure time increments** : The pixel clock is the base clock that the exposure time is being set by. The smallest increments of the exposure time can be calculated by:

$$\text{Smallest Exposure Time Increments} = \frac{1}{\text{pixel clock}} = \frac{1}{15\text{MHz}} = 66.6\text{ns}$$

### Mode 2: Fixed line scan rate mode

- The line scan rate is programmable and controlled by changing the Timer1 setting in the EXPOSURE SIGNAL menu in Matrox Intellicam.
- The exposure time is the period between the rising edges of the EXPOSURE1 (EXSYNC) pulses.
- The default exposure time for this DCF is  $\cong 1$  ms.

- To modify the exposure time, reduce or increase the inactive period of the EXPOSURE1. **Note**, it is important that the period of EXPOSURE1 signal be longer than the video valid output + the video valid output time. The exposure pulses can be easily changed with either Matrox Intellicam, Genesis Native Library function **imCamControl()** or with the MIL digitizer control function **MdigControl()**. Refer to the appropriate manual or user guide for additional information.

# Application Note:

## Interfacing non-standard cameras to Matrox Genesis

DALSA CT-C5-4096A

April 23, 1998

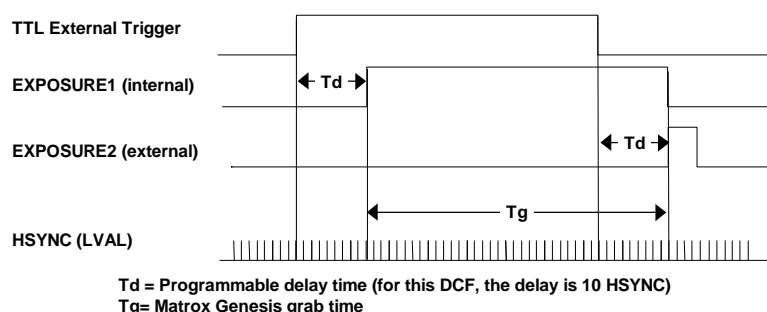

### Camera Interface Details (continued)

**Maximum line rate, Minimum exposure time, and Smallest exposure time increments:** are the same as for Mode 1

- Note, in this DCF the PRIN signal is connected on EXPOSURE 2 of the Matrox Genesis and is always active.

#### Mode 3: Fixed line scan rate with variable frame size (with programmable delay)

- Number of lines per virtual frame is determined by external trigger period. To change the number of lines per virtual frame, reduce or increase the active period of the TTL external trigger signal; lines are grabbed only when trigger is active. Virtual frame size is 500 lines maximum for this DCF and is dependent upon the trigger active (high) period.
- The line scan rate is fixed and controlled through Matrox Intellicam.
- The exposure time is the period between both rising edges of the HSYNC OUTPUT (EXSYNC).
- The default exposure time for this DCF is  $\approx 100\mu\text{s}$ .
- To modify the exposure time, reduce or increase the **FPorch** setting within the VIDEO TIMINGS menu of Matrox Intellicam. Note, it is important that the period of the HSYNC OUTPUT (EXSYNC) signal be longer than the video valid output delay + the video valid output time.
- The pixel clock supplied by the camera is 15 MHz.
- The TTL external trigger is input on the Matrox Genesis via the analog video input connector trigger pin. The rising edge of this trigger signal starts Timer1. Following the programmable delay period ( $T_d$  = delay between the TTL external trigger and EXPOSURE1 signal), EXPOSURE1 will become active. The falling edge of the trigger signal will start Timer2. Following the programmable delay period, Exposure2 will be come active and thereby clear EXPOSURE1 and end the grab period.
- To modify the programmable delay time, reduce or increase the inactive period of EXPOSURE1 and EXPOSURE2 signals in the **Delay** setting found in the EXPOSURE SIGNAL sub-menu (Timer1 and Timer2).

**Maximum line rate, Minimum exposure time, and Smallest exposure time increments:** are the same as for Mode 1: *Variable line scan rate mode*

## Interfacing non-standard cameras to Matrox Genesis

DALSA CT-C5-4096A

April 23, 1998

### Cabling Requirements (continued)

- The connections between the DB-25 connector on the rear panel of the camera and the 100-pin connector of the GEN-DIG-BRD/S are as follows:

DALSA CT-C5-4096A (DB-25 male connector)		GEN-DIG-BRD/S (GEN/CBL/OPEN connector)	
<i>Pin name</i>	<i>Pin no.</i>	<i>Pin name</i>	<i>Pin no.</i>
MCLK	06	not connected	
MCLKB	19	not connected	
EXSYNC	17	EXPOSURE, OUTPUT, 1+	95
EXSYNCB	04	EXPOSURE, OUTPUT, 1-	96
PRIN	05	EXPOSURE, OUTPUT, 2+	97
PRINB	18	EXPOSURE, OUTPUT, 2-	98
LVAL	02	not connected	
LVALB	15	not connected	

- The connections between the DB-25 connector on the rear panel of the camera and the power supply are as follows:

**NOTE:** it is very important that all the GROUNDs of the camera be connected together to the POWER SUPPLY GROUND, and to the GROUND of the Matrox Genesis. Do not use the cable shield as a ground, instead always use the ground pin of the power supply.

### Mode 2: Fixed line scan rate

- All connections, except IMG-7W2-TO-5BNC cable (no TTL external trigger), are as in Mode 1: *variable line scan rate*.
- Matrox cable kit (GEN-TO-DALSA/32) is available for this mode as an alternative to custom cable development based on the pin-outs listing.

### Mode 3: Fixed line scan rate with variable frame size (with programmable delay)

- IMG-7W2-TO-5BNC cable required for TTL external trigger source and GEN-DIG-BRD/S required for digital data, syncs and control signals in RS-422 format.
- TTL external trigger source should be connected to the TTL trigger input of the IMG-7W2-TO-5BNC cable
