

A Macro to Monitor Your Keystrokes
By Elden Nelson
WordPerfect Magazine

Note: The majority of this article is about creating certain kinds of macros. That text has been deleted.

When you run the included MONITOR.WPM macro, it won't seem to do anything at all. Use WordPerfect the way you normally do to create documents. However, notice as you type how the macro monitors every keystroke and remembers the two most recent keystrokes. For example, if the two most recent keystrokes are two hyphens (- -), the macro catches it and converts them into an em dash (—). Likewise, it checks for two spaces and converts them into just one. Finally, if the period key is pressed twice, the macro generates ellipsis points (. . .) with hard spaces between the periods so they won't be broken up over two lines.
